Abstract (en)

[origin: EP0538197A1] A device which is used as connection between at least one flexible pipeline (1), laid under plaster, and a fitting to be arranged over plaster comprises a socket (4, 5a, 5b, 6) and an angled pipe piece (3) which can be introduced into the socket (4, 5a, 5b, 6). The socket (4, 5a, 5b, 6) has a socket head (54) and at least one socket neck (55). The socket neck (55) contains both the connected end of the angled pipe piece (3) and a portion of at least one pipeline (1) connected to the angled pipe piece. According to the invention, the socket neck (55) is designed to be capable of bending (59). At the lower end of the socket neck (55) there is preferably provided an offset clamping member (60) which is, however, connected to the socket neck via a connecting web (61) and is intended for the fixed clamping of an outer pipe (2) of the pipeline (1).
