Abstract (en)

[origin: EP0538210A1] In order to make the upper molding (2) adjustable in height relative to the front side (1) of a built-in appliance, said molding (2) is provided, on the inner surface thereof, with slots (4) adapted to receive each time one of the two free ends (5,7) of a substantially Y-shaped elongated resilient member (3a) having the third end thereof fastened to the front side structure. The second free end of said member communicates with the outside by means of an opening (10) through which a tool may be inserted in order to act on said end, whereby said member is inflected and the second end (5) thereof is set free from the previously engaged slot (4), in order to perform locking within another slot to change the height position of said molding (2). <IMAGE>
