Abstract (en)

[origin: EP0539622A1] In the case of a modular design for lamps or lighting systems, use is made inter alia of support rails having a V-type cross-sectional profile, which are arranged parallel to one another in mirror-image fashion and supplemented to form a support frame which can then be supplemented by receiving modular components to form lamps or rail-shaped lighting arrangements. A particularly advantageous cross-sectional profile is specified for such a support rail, in which an upper, convexly curved rail part (2) and a lower, likewise convexly curved rail part (3) are connected to one another by a transverse wall (4) which subdivides the rail interior into a large receiving chamber (5) open on one side and a small receiving chamber (6). In the region of the small receiving chamber (6), the upper rail part (2) is configured to form a cover (21) and the transverse wall (4) has at the level of the cover (21) a rectangular groove (41), open towards the cover (21), for the engagement of fastening means. <IMAGE>
