Abstract (en)

Heat exchanger comprising a plurality of substantially parallel tubes, which can be joined together in rows and are intended for the circulation of a first fluid, a second fluid circulating outside the tubes in a direction which is globally perpendicular to the direction of the said tubes. Each tube in one row is connected to two adjacent tubes in the same row by a sheet (2) of expanded metal which is integral or made integral with the two tubes which it joins, along a generatrix of the latter. The sheets (2) joining the tubes are formed by a single piece from one end to the other in the same row of tubes. The said piece consists of a strip having, after punching and longitudinal stretch-forming, an alternating configuration of perforated portions and non-perforated portions (3) used to form tube portions or to receive preformed tubes in close contact. These heat exchangers can be advantageously used for exchanges between a liquid circulating in the tubes and a gas (for example air) circulating in crossed currents outside the tubes. <IMAGE>

Abstract (fr)

Echangeur de chaleur comprenant une pluralité de tubes实质上是平行的，可以被连接在一起成行，并且是为第一种流体的循环和第二种流体循环在外的管子的方向是全局上垂直于所述管子的方向设计的。每根管子在一行中连接到同一行中的两个相邻管子上由一个膨胀金属片(2)。该片是整体的或与两根管子一起整体的，它连接着它们，沿着后者的一个生成元。这些连接管子的片是由一根从一端到另一端的单根条带形成的。该条带在冲孔和纵向拉伸成型后具有交替配置的穿孔部分(3)和非穿孔部分，用于形成管子部分或接收在密切接触中的预成型管子。这些热交换器可以有利地用于液体在管子中循环和气体(例如空气)在管子外的交叉气流中循环之间的交换。<IMAGE>
