Abstract (en)
[origin: EP0539746A1] In order to protect frames of doors, windows and the like, which are to be laminated, from damage, a device consisting of a number of angular profile pieces (1) made of elastic material is proposed. The profile pieces (1) can be clamped in a manner distributed at intervals over the circumference of each frame (4). In order to attach the profile pieces (1) sufficiently firmly to the frame (4) by simple manual action and also to be able to loosen them from it by simple manual action, each profile piece (1) can be supported against an outer face (5), to be protected, of the frame (4) by means of a leg (2) oriented parallel to the plane of the frame (4) and against an inner face (6) of the frame (4) by means of a fixing leg (3) oriented perpendicularly to the frame plane. A clamping part (8) branches off from the fixing leg (3) in such a way that it can be pressed frictionally into a groove (9) which is provided, in any case, on the inner face (6) of the frame (4), in order to receive therein an edge strip of a plate-shaped frame filling. <IMAGE>
