Abstract (en)  
[origin: EP0539785A2] The invention relates to an adjustable fixing device which can be installed into an opening of a vehicle body. The adjustable fixing device has a screw connection with which a wall section of a carrying element, produced from plastic, can be non-adjustably fixed to a part of a vehicle body. The wall section of the carrying element has a groove in whose base a fixing opening is made, through which opening the fixing bolt of the screw connection passes. A head of the screw connection rests on a plain washer arranged between the head and the wall section. In the central opening of the plain washer, the fixing bolt is held in the longitudinal extent of the groove largely without play. The plain washer rests with narrow side faces on the surface sections of the groove which face one another and extend in parallel with one another. In this arrangement, there is such a positive and/or frictional engagement on the contact faces that when the vehicle light is adjusted, and thus when the screw connection is loosened, the plain washer can be displaced in the longitudinal extent of the groove above a specific minimum force. <IMAGE>
