Abstract (en)
[origin: EP0518252A1] A container, consisting of a hollow shaped body (1), in particular of plastic material, - having an upper part (2) and a lower part (3) which can be separated to receive objects, - having end faces (7) which are arranged perpendicular to the longitudinal axis of said body, and of which in each case one has a projection (5) and the other has a cutout (15) in which the projection (5) of the one end face can be inserted to produce a releasable connection, and - having connecting means (4) on the circumference of at least one of the parts (2, 3) of the shaped body (1), is constructed for the purpose of bringing about sliding or plug-in connection possibilities in virtually any directions and for use as a plug-in module for a plurality of dimensions, in such a way - that a projection (5) is provided in one of the end faces (7) which contains the cutout (15) to receive the projection (5) of the other one of the end faces (7), and - that recesses (4) and elevations (8) which alternate with one another are provided on the circumference of the at least one part (3) of the shaped body (1), by means of which recesses and elevations a sliding or plug-in connection can be produced, by engagement of at least one elevation (8) in at least one recess (4), on the circumference of different shaped bodies (1) in each case.
