Abstract (en)
[origin: EP0542063A1] An eccentric valve (1) having an actuating device, operating via a Bowden cable (24), for sinks is to be designed such that small overall height is achieved with a simple, robust and reliable construction and low production outlay. For this purpose, it is proposed that the housing (2), designed with small overall height, have a lateral projection (7) which does not extend over the upper and lower horizontal delimitation of said housing and in which, at a part-height of said projection, there is mounted an eccentric bolt (19) which is connected in a positively locking and rotationally fixed manner to a support lever (16) which is guided in a valve slot (17) and the free end of which engages beneath a guide bolt (11) of the covering plate (12), and that that wall of the housing (2) directed away from the projection (7) has the horizontally and radially directed connecting piece (4). <IMAGE>
