Abstract (en)

[origin: EP0542334A1] A window check comprises two legs (1, 2) which are connected in an articulated manner and, on their end directed away from the mutual pivot point, in each case have a fastening device (4, 5) for fastening on a window and an appertaining window frame, said window check further having locking means in order to lock the legs (1, 2) at least in an angled position with respect to each other. These locking means comprise a leaf spring (11) and at least one rolling body (14, 15) which can roll over said spring, the leaf spring (11) being bent by the rolling body (14, 15), during the hinge movement of the legs (1, 2), such that, in a locking position, the leaf spring (11) and the rolling body (14, 15) interact under spring prestress. In this manner, a very stable locking position can be ensured while, on the other hand, the amount of force necessary for adjusting the window check can remain restricted. <IMAGE>
