Abstract (en)
In a building structure comprising two parallel rows of uprights (1), at least some of the uprights in each row are connected by rigid cross-members (2,3). The uprights (1) and cross-members (2,3) are provided with means for connection at a range of angles in both the horizontal and vertical planes. The building structure is advantageous primarily in that it can be readily erected, even on a site which is on, or which includes, an inclined surface, using standard components and without the need for surveying. <IMAGE>
