Abstract (en)  
[origin: WO9202671A1] In a flat knitting machine with at least one combined knitting and take-up block a brush holder (4) with a brush (5) to open the latch-needles is secured in the block region of a slide (1). The brush holder (4) is fitted to move on the slide (1) parallel to the running direction of the slide (S). This provides for the certain and reliable actuation and deactuation of the brush (6) for the knitting or take-up region, whereby this switching process requires little space and can be obtained with simple means.
