Abstract (en)

[origin: EP0543696A1] This is a device comprising a door (1) which is in a vertical position when closed. Its front face (3) has a cladding panel (5). At least a first unit (60) fixed to the cladding panel (5) serves to stabilise the panel and the door from relative movement in a horizontal direction, from front to back and from back to front. A second unit (50) works in conjunction with an auxiliary unit (55). The first unit (60) and the second unit (50) associated with the auxiliary unit (55) stabilise the panel (5) and the door (1) from relative movement in the plane of the front face (3), respectively in a first direction and in a second, opposite, direction. The auxiliary unit (55) is accessible from the rear face (40) of the door (1). Applicable to domestic electrical appliances, particularly dishwashers. <IMAGE>
