Abstract (en)

[origin: EP0544029A1] The prevention of floating-substance deposits in the surplus disposal works of sewerage systems essentially reduces pollution-load disposal into the receiving channels. For this reason, the floating downflow baffles, which prevent the siphon-type disposal state, in particular of fixed downflow baffles, represent essential technical progress. The improvement of the guiding and sealing properties and the use of mass-production of floating downflow baffles can be achieved, however, only with the aid of a guiding (8) which is designed for this development and plays a part in conforming to the diverse installation criteria in surplus disposal works. <IMAGE>
