Abstract (en)  
[origin: EP0544219A1] The lock with burglar-proof locking bolt, particularly for safes, comprises a locking bolt (3) slideable between a position in which it engages the selvage (8) in the abutment jamb (9) of the door of the safe and a position in which it engages a seat (7) in the lock stile (1) of the door, the bolt being loosely coupled to a lever (4) which is articulated to a movable element(2) actuated by the lock and which is provided with a tooth (10); mutual contact planes (11,13) are defined in the locking bolt and in the lever and are inclined with respect to the sliding axis of the locking bolt so as to produce, when the locking bolt is forced to retract into the seat, the oscillation of the lever into the position in which the tooth interacts with the edge of the seat. <IMAGE>
