Abstract (en)

[origin: WO9204053A1] Homoconjugated antibodies with high avidity for antigen have increased therapeutic activities and are utilized in pharmaceutical and diagnostic compositions. The homoconjugates, typically prepared from monoclonal antibodies of the IgG class which bind to the same antigenic determinant, are covalently linked by synthetic cross-linking. The homoconjugates are comprised of at least two immunoglobulin monomers so as to provide an IgG-like molecule which is tetravalent, hexavalent or more for the selected antigen. The homoconjugates are able to cross the placenta. Methods of treatment using these homoconjugates are also provided.
