Abstract (en)

[origin: DE4123047A1] The invention concerns a method for mixing drink components, in particular syrup and water, in which the first component is fed from a reservoir into a metering chamber with a given volume, the amount of the second component required to give the desired concentration measured out, and both components fed into a storage tank. If the reservoir contains an insufficient supply of the first component, the metering chamber is only partly filled with the first component, the amount of the first component introduced into the metering chamber measured and a corresponding amount of the second component measured out. This enables even small amounts of syrup left in the reservoir to be used up, while continuing to produce a drink of the same concentration.
