Abstract (en)

[origin: EP0548536A1] In a known heater of the generic type, a heat exchanger arranged in a domestic water storage tank is connected in parallel with the two appliance connections for the heating network and an additional storage tank is provided next to the domestic water storage tank in order to compensate the output deficit of the heat source of the heater at the beginning of domestic water tapping. As a result of the series connection according to the invention of an internal, domestic water-bearing hot water circuit 40a, 40b to the pipe system 52a, 52b for the heating water, as well as its heating taking place directly via the hot water circuit 52a, 52b, the output/volume ratio of the heater can be optimised and the domestic water convenience of an installation with externally installed domestic water storage tank can be achieved. Preferred area of application is heaters with a gas burner as heat source. <IMAGE>
