Abstract (en)
Improved doll,a configuration being adopted inside the doll allowing an electronic circuit -1- to be included therein and essentially comprising a connector -2- located at the doll's back, this connector being operated with a pushbutton, and a plurality of sensors -5- located at different parts of the doll's anatomy, and only one of these sensors is randomly operative while the others are operated by touch so that upon their operation a sound of a greater intensity than that produced by the pushbutton switch-2- would be released.Selection of a new sound with a second touch will release a different sound, heard for some time, after which the original sound would again be heard. The operation of sensors -5- activates a synthesised sound source which after going through the conforming filters making up the nature of said sound is reaching an amplifier and hence to the loudspeaker -6-converting the sounds into audible. <IMAGE>
