Abstract (en)

The adjustable hinge comprises a pivot (7) divided into two basically identical parts (7a, 7b) united by a collar (11) and permanently offset one from another, of which one affords a tooth (12) located adjacent to the collar and designed to enter into positive engagement with one of a set of matching seats (13) distributed uniformly around the mouth of a relative alignment bush (9); an adjustment is effected by lifting the pivot (7) sufficiently for the tooth (12) to clear the seat (13), and rotating left or right such that the mutual positions of the two hinge bosses (1, 2) are altered by the changed position of the pivot. <IMAGE>
