Abstract (en)

[origin: EP0554152A1] The container according to the invention comprises a peripheral rim (1), on which is fixed a lid (2) comprising an upper subassembly (I) comprising at least one layer of material forming a barrier (3), as well as a lower subassembly (II) comprising a layer of heat-sealable material (4) fixed by heat-sealing onto the peripheral rim. It is characterised in that the lower subassembly (II) comprises, at least in a region of its part which overhangs the peripheral rim (1), a layer of varnish with permanent adhesive power (6), interposed between the layer (3) and the layer (4), once the lid (2) has been broken, either between the layer of varnish (6) and the layer (3) or between the layer of varnish (6) and the layer (4), or in the bulk of the varnish. With the varnish having been uncovered after opening the container, it is sufficient to return the lid into place in order to close the said container. <IMAGE>
