Abstract (en)

[origin: EP0554159A1] The shielded so-called fishbone connection has multiple branches coming from a trunk divided into sections by the branch-off points of the branches. It is characterised in that it is shielded exclusively, on the one hand, by first braids (2) installed on the individual branches (B), each with a first break-out on at least one of the sections on either side of the branch in question (B5) and, on the other hand, by second braids (6) installed on the individual sections (T), each braid with a second break-out on the adjacent section (T6) of smaller diameter than that (T5) in question. Application: shielded connection supplying multiple points from a common starting point. <IMAGE>
