Abstract (en)

[origin: WO9208078A1] An advanced ovenfire air system for NOx control designed for use in a firing system of the type that is particularly suited for use in fossil fuel-fired furnaces and a method of operating such a furnace which embodies an advanced ovenfire air system. The advanced ovenfire air system for NOx control includes multi-elevations of ovenfire air compartments consisting of a plurality of close coupled ovenfire air compartments (84, 86) and a plurality of separated ovenfire air compartments (94, 96, 98). The close coupled ovenfire air (84, 86) compartments are supported at a first elevation in the furnace (10) and the separated ovenfire air compartments (94, 96, 98) are supported at a second elevation in the furnace (10) so as to be spaced from but aligned with the close coupled ovenfire air compartments (84, 86). Ovenfire air is supplied (106, 92) to both the close coupled ovenfire air compartments (84, 86) and the separated ovenfire air compartments (94, 96, 98) such that there is a predetermined most favorable distribution of ovenfire air therebetween, such that the ovenfire (106) air exiting from the separated ovenfire air compartments (94, 96, 98) establishes a horizontal "spray" or "fan" distribution (124, 126, 128) of ovenfire air over the plan area of the furnace, and such that the ovenfire air (106) exits from the separated ovenfire air compartments (94, 96, 98) at velocities significantly higher than the velocities employed heretofore.
