Abstract (en)

[origin: EP0555856A1] For adjusting the operating point (W) of a web run control installation beyond the measuring range (D) of the sensor (1), a threshold (3) within the measuring range (D) of the sensor (1) is predetermined in the electronic signal processing device (4) and, when the said threshold is reached by the operating point (W) during the operating point adjustment, the web run control is switched off and an edge-searching operation of the sensor (1) is triggered in order to align the sensor (1) with the changed position of the web edge (2), whereupon the web run control is switched on again and this operation is repeated until the desired operating point displacement is achieved. <IMAGE>
