Abstract (en)
[origin: WO9208734A1] Two Hepatitis C Virus envelope proteins (E1 and E2) are expressed without sialylation. Recombinant expression of these proteins in lower eukaryotes, or in mammalian cells in which terminal glycosylation is blocked, results in recombinant proteins which are more similar to native HCV glycoproteins. When isolated by GNA lectin affinity, the E1 and E2 proteins aggregate into virus-like particles. Cells bearing a mannose receptor or asialoglycoprotein receptor are capable of being infected with HCV, and supporting culturing of the virus.

Abstract (fr)
Deux protéines d'enveloppe (E1 et E2) du virus de l'hépatite C sont exprimées sans sialylation. L'expression recombinée de ces protéines dans des eucaryotes inférieurs, ou dans des cellules mammifères dans lesquelles la glycosylation terminale est bloquée, permet d'obtenir des protéines recombinées plus semblables à des glycoprotéines natives du virus de l'hépatite C. Lorsqu'elles sont isolées par affinité avec la lectine GNA (Galantus nivalus agglutinine), les protéines E1 et E2 s'agrègent dans des particules analogues au virus. Les cellules porteuses d'un récepteur de mannose ou d'un récepteur d'asialoglycoprotéine peuvent être affectées par le virus de l'hépatite C, et apporter leur concours à la culture du virus.
