Abstract (en)

[origin: EP0557661A1] The automatic dispenser device for portable objects comprises, in a cabinet (10), at least one dispenser unit (24) suitable for dispensing portable objects, one by one, outside the cupboard. The dispensing unit (24) is intended to house a container device in which a stack of portable objects is piled. The container device is formed by two shells assembled together in such a way that they cannot be dismantled without breaking, defining, at one of the ends of the container device, a transverse outlet slot for the portable objects which is normally obstructed by means forming the breakable tell-tale. The container device is placed in the dispensing unit (24) only in the event that the said container device satisfies a predetermined condition relating to the integrity of the assembly and of the means forming a tell-tale, which makes it possible to confer a high degree of security on the installation of the said container device in the dispensing unit. <IMAGE>
