Abstract (en)

[origin: EP0557723A1] In gripper looms with a transfer of the weft thread in the middle of the shed, there is the fundamental problem that the elements inserting the weft thread, that is to say the grippers, have to be guided into the shed in such a way that the thread transfer in the middle of the shed takes place without colliding contact of the two gripper heads. <??>This is achieved, according to the invention, in that, among other things, each gripper (1) has, at least on one side of its longitudinal extension, an additional guide face (14a, 17a) which is temporarily connected in a slide-guiding manner to guide levers (5) pivotable into and out of the lower shed (13) under control. <IMAGE>
