Abstract (en)  
[origin: EP0557724A1] The invention relates to a convertible temple for air-jet looms, of ball-shaped cross-section, with a projection which points, in the region of the front fabric deflection, essentially towards the middle of the weft-insertion channel of a reed and the top side of which forms a supporting surface for the fabric, and with a spreader element arranged both at the fabric entrance and at the fabric exit of the temple. In the solution according to the invention, between the exit spreader element 9 and the spreader element 8 integrated in the temple 1 in the region of the front fabric deflection, a fabric-deflecting element 12 designed in the manner of a half-shell can be inserted into the ball-shaped part of the temple 1 and connected to the temple, in such a way that there can be formed between the entry spreader element 8 and the end 12a of the deflecting element 12 resembling a half-shell a fabric slit 16, the clear width of which is variable in dependence on the diameter D of a temple bar 15 carried rotationally by the fabric 7. <IMAGE>
