Abstract (en)

[origin: EP0558777A1] Large-volume bellows which are intended for installation between two rail vehicles which can be coupled to one another in an articulated fashion, and have at each of their ends an attachment frame for attachment to one of the two vehicles and which is divided in the centre between the two attachment frames, each half of the bellows being assigned a coupling frame at its end facing away from the attachment frame, in which case the two coupling frames are to be centred with respect to one another by centring means in order to be connected to one another in a desired position with respect to one another by connecting means, characterised in that the two coupling frames (8, 9) have precentring means (10, 11) with a relatively long centring path and final centring means (21, 22) with a relatively short centring path. <IMAGE>
