Abstract (en)

[origin: EP0559085A1] The invention relates to a drain (A), for ground or terrace, which exhibits a drain body (K), which can be secured in the ground (8) and is composed of a collar (1) with a cylindrical receiving depression (5) and of a drain connection stub (3), a covering ring (R), which can be rotatably introduced into the receiving depression, and a grid frame (T) which can be rotatably introduced into the covering ring (R) by means of a pipe connection stub (15) and has a rectangular or square outline, the outline of the grid frame (T) being transversely displaceable relative to the axis of the receiving depression. In the case of said drain, the grid frame (T, 17), together with its pipe connection stub (15), can be transversely displaced, relative to the central axis (4) of the covering ring (R), in a rectilinear sliding path (S) running transversely in the covering ring (R), said frame being secured in a holder (G) which can be displaced non-rotatably in the sliding path (S). In addition, the grid frame (T, 17) can be vertically adjusted in the holder (G) at least to a limited extent. <IMAGE>
