Abstract (en)
[origin: EP0559521A1] The present invention relates to control devices for a variable controller 2 with a slider 14. The device is characterised essentially in that it includes a housing 1, a trigger 3 capable of moving in translation between two positions with respect to the housing, one of the two positions constituting a rest position, means 13 for applying an elastic force on the trigger in order to tend to bring it back towards the rest position, means 45 for coupling the trigger with the slider 14, a lever 9, means 46 for mounting the lever in rotation with respect to the housing around a first spindle 17, means for converting the rotational movement of the lever into translational movement of the trigger, a slide 31, means 28 for mounting the slide in translation with respect to the housing, one extremity 37 of the slide being able to come into contact with the trigger, and means 10 for controlling the translation of the slide 31. <IMAGE>
