Abstract (en)

[origin: EP0559530A1] The invention relates to a method and a system for artificial spatial processing of digital audio signals $x(k)$. They consist in or make it possible to effect on elementary signals $x_i(k)$, replicas of the digital audio signal, the different delays producing delayed elementary signals ($\bar{x}_i(k)$) which, after weighting, are summed with the signal $x(k)$ to produce the spatially processed digital audio signal $y(k)$. A plurality of linear combinations of the signals ($\bar{x}_i(k)$) as combined delayed elementary signals ($\bar{x}_{ci}(k)$) is summed with the elementary signals $x_i(k)$. In order to simulate a sluggish reverberation, the linear combinations are effected through unit looping, and an attenuation $h_i(\omega)$, a decreasing monotonic function of the reverberation time $T_r(\omega)$ to be simulated and proportional to the delay, is effected with each delay. A spectral correction prior to weighted summation is effected satisfying the relation: <IMAGE> τ_i denoting the value of each delay increased by the phase delay due to the attenuation. <IMAGE>
