Abstract (en)
[origin: EP0559605A2] The basis of obtaining the system presented here is a modular combination of a person-related first unit with a transmittable/receivable memory element via an antenna, which unit, alone or together with a further unit, works with an additional, but different identification part, and of a non-person-related, but object-related second unit for interaction between person and object, and with means for monitoring and maintaining the interaction, by means of which the units and objects are interlinked. The person-related first unit is bearer-oriented. It is located permanently or releasably on an article of use, for example on a key, in an identity card, on or in a watch or any article moving around with the person, and it does not have fixed coordinates. The object-related second unit is place-oriented. It is located in fixed places (for example, doors on buildings), and therefore has fixed coordinates or else is arranged fixedly on movable objects (for example, vehicles). <IMAGE>
