Abstract (en)

[origin: US5343730A] The turning device has a guideway (13) which is formed integrally on the tong carrier (3) and in which is guided the roller (16) of an oscillating lever (15). The reciprocating movement of the guideway (13) is transmitted via the oscillating lever (15) to a pivot pin (14). The latter turns the portion (A) in conjunction with a counter-holder (22). The turning device is used on horizontal cross-transfer presses having a high production rate for metal forming starting from portions of wire.
