Abstract (en)  
[origin: EP0560308A1] A description is given of a shuttering for shuttering end surfaces (1c) of two neighbouring concrete structural-part portions (1) of predetermined thickness (D), having a sheet-like shuttering wall (3) containing an expanded-metal panel (3a, 3b). The shuttering further contains a seal (4) which spans a joint between the two structural-part portions (1). In order to protect the expanded-metal panels against corrosion, it is proposed that the expanded-metal panel (3a, 3b) be designed such that it is narrower than the predetermined thickness (D) of the structural-part portion (1), an interspace, in which a concrete covering strip (12, 13) is arranged, remaining between at least one free edge (10, 11) of the expanded-metal panel (3a, 3b) and an outer surface (1a, 1b) of the structural-part portion (1), and the concrete covering strip (12, 13) exhibiting a cutout (12a, 13a) for receiving the free edge (10, 11). <IMAGE>
