Abstract (en)

[origin: EP0561027A1] The invention relates to a vector brush (2) which can be mounted on the end face of a carriage (9) of a film-material cutting device. The vector brush (20) is inserted into vertical guide grooves (34, 35) of the carriage (9) and clamped tight against the latter. An air brush (22) forming part of the vector brush (20) can be vertically adjusted and therefore produces spraying cones of different sizes. The movement of the air brush (22) is controlled by the movement of the carriage (9) in the Y-direction and by the movement of the film web, which is passed through below it, in the X-direction. When a pattern has been sprayed with the vector brush (20), it can be immediately cut out using the cutting tool mounted on the same carriage (9). <IMAGE>
