Abstract (en)
[origin: EP0561254A1] The invention relates to a safety device for a door lock, especially for house doors (4), with a bolt (1) which at least partially covers a door lock (2) and which is designed to assume its open position (17) automatically and can be fixed in its locking position (12) by a key (3) inserted in the door lock. The door-lock safety device constitutes means to prevent being locked-out and an additional safeguard against break-in, in which, on the one hand, it is impossible for the key (3) to be left inserted in the door lock (2) when the house is left and, on the other hand, it is impossible for the key (3) inserted in the door lock (2) to fall out or be pushed out. <IMAGE>
