Abstract (en)

[origin: EP0562982A1] The present invention relates to an integrated circuit comprising a network of diodes, including first Schottky diodes, each one of which is connected by its cathode to a point to be protected and by its anode to a reference voltage, and second Schottky diodes, each one of which is connected by its anode to a point to be protected and by its cathode to the cathode of an avalanche diode whose anode is at the reference voltage. This integrated circuit comprises, in a P-type substrate (1), a first (10) and a second (20) group of N-type wells; a resistive (ohmic) contact (12, 22) and a Schottky contact (11, 21) on each well; an N-type region (3) on the upper surface of the substrate; a metallization (A) connecting the resistive contacts of the first group of wells to the N-type region; a metallization (C) connecting the Schottky contacts of the second wells; metallizations (B1-B8) respectively connecting a Schottky contact of the second group of wells to a resistive contact of the first wells; and a rear face metallization (M). <IMAGE>
