Abstract (en)

[origin: US5435588A] A ski including a first sub-assembly or base having its own distribution of stiffness and a second upper sub-assembly or stiffener connected to the base by means of flexible and/or partially rigid connections. The stiffener includes two parts separated and spaced from one another by a short distance when the ski is at rest. The two parts cooperate with each other when the ski is biased flexionally in certain functional conditions so as to increase the stiffness of the ski.
