Abstract (en)

[origin: EP0563836A2] The invention relates to a method of measuring the driving capability of a drive, provided with a carrying rope run over a driving pulley, of a hoisting system, in particular a lift system, with a car hanging on one end of the carrying rope and a counterweight hanging on the other end of the carrying rope, the carrying rope being relieved of load on one side until the driving pulley slips under the carrying rope in sliding friction such that a measured value is determined in the process from which the driving capability is deduced, and to a lift system for carrying out the method. <IMAGE>
