Abstract (en)

A process for producing a light-sensitive silver halide photographic material. The process comprises steps of (1) coating one or more layers including at least one silver halide emulsion layer on a support, (2) drying the one or more layers, and (3) winding up the support with the dried coating layers. In the above process, the total amount of gelatin provided on the emulsion coated side of the support is not more than 2.9 g per square meter, and the surface of the coating layers is contacted to air having an absolute humidity not higher than 0.5 % or a relative humidity not higher than 5 % for a time not shorter than 5 seconds at a time after completion of drying step and before start of winding up. Light-sensitive materials produced by the process has a high dimension stability during photographic processing.
