Abstract (en)

[origin: EP0564345A1] The apparatus comprises a compression foot (2) onto which is brought a tin (1) and which is driven in a vertical translation movement by a telescopic rod (7) under the command of a roller (15) engaged in a cam path (17). During the upward stroke of the rod (7), its two constituent elements are locked hydraulically by the presence of oil in a closed intermediate chamber (8); this oil escapes therefrom, at the end of the stroke, via a passage (25, 21), releasing a spring (13) which determines the force which compresses the tin (1) against a fixed mandril (3) during the crimping operation. <IMAGE>
