Abstract (en)
[origin: US5480175A] An interface device between a ski and front and rear bindings (2, 3) designed to hold the ends of a boot in place on the ski. The device comprises a plate (13) with an elongated central part (14) which extends above the upper surface of the ski in the area of the runner. A first end (15) of the plate is fastened to the ski, and a second end (16) is attached to the ski by a block of damping material (17) mounted in a sandwich configuration between the end of the plate and the ski. The block of damping material is preferably provided in order to function under compression and shearing action.
