Abstract (en)

[origin: EP0564806A2] The invention relates to a coding device for a multipole plug connector which has at least two parts, is preferably box-shaped and in the case of which a plug pin housing and a plug socket housing are connected to one another such that they can pivot about a pivoting axis, and being capable of being plugged together and disconnected using a pivoting movement in the form of a circular arc, latching means (which can be unlatched) being provided between the housing to secure the correct plugged-together contact-making state of the plug connector, characterized by coding elements which engage in one another in a positively-locking manner when pivoting-shaft elements of the housing (which form the pivoting axis) are being assembled, are arranged in the region of the pivoting-shaft element and do not impede the pivoting movement.
