Abstract (en)

[origin: EP0565122A1] The invention relates to a working process for the double-bobbin production of a double-plush fabric with a double-weft weave for the active pile threads (P9 or P10) and with tied-in dead pile threads (P10 or P9), the weft-insertion aids being brought alternately to the height (hB1, hB2) of the upper fabric and to the height (h01, h02) of the lower fabric; two weft threads (IB1 and IB2) or (I01 and I02) located one above the other are introduced each time into that upper fabric or that lower fabric, whilst in each repeat, in respect of the two double wefts (IB1, IB2) and (I01, I02) of that repeat, the active pile thread (P9 or P10) is brought above the two weft threads (IB1, IB2) in the upper fabric and below the two weft threads (I01, I02) in the lower fabric. The invention relates, furthermore, to a double-plush loom, in which two or more upwardly and downwardly movable weft-insertion aids can be driven, in order to move these jointly upwards and downwards in an exactly coordinated cycle so as to carry out the working process according to the invention. <IMAGE>
