Abstract (en)

The present invention provides a method of producing a zinc-chromium alloy-plated steel sheet having excellent properties such as bare corrosion resistance, corrosion resistance after coating, plating adhesiveness and weldability. The method is characterized by plating the surface of the steel sheet using an acid plating bath containing zinc ion (Zn^{2+}) and chromium ion (Cr^{3+}) at a molar concentration ratio of about 0.1 \leq Cr $/$ (Zn $+Cr$) \leq 0.9 in a total amount of at least about 0.5 mol/l within the dissolution range, and about 0.1 to 30 g/l of at least one nonionic organic additive having at least a triple bond, at a bath temperature of about 25 to 70 DEG C and a pH of about 1.0 to 4.0 with a current density of about 50 to 200 A/dm 2 .
