Abstract (en)

In the optical system, at least a part of at least one of the diaphragm plates is composed of a neutral density filter for causing a difference in quantity of light in a peripheral part and a central part of luminous flux passing the diaphragm, and by varying the position of each diaphragm plate, the quantity of transmitted light is adjusted, so that deterioration of MTF characteristic due to diffraction can be avoided even when the diaphragm is small, while the depth of field is maintained. <IMAGE>
