Abstract (en)

Frame having a primary structure and a secondary structure, the first structure being suspended from anchoring points by way of suspension devices, and the second structure, arranged orthogonally with respect to the first structure, being fixed to the said first structure by way of connection devices equipped with snap-locking means, which is characterised in that the primary structure is made up of support profiles (1) which are parallel to one another and of U-shaped, C-shaped or I-shaped cross-section, provided with a means (2, 4, 5, 6, 20, 21) for presetting the assembly of the secondary structure, permitting the automatic positioning of the connection device (7); the connection device (7) between the profiles (1, 3) of the primary structure and of the secondary structure is a stirrup of U-shaped cross-section comprising a means (13, 20, 21) for adaptation to the means for presetting the primary structure; the suspension device (14) of the frame formed is a polygonal bracket which is easy to open and close, has an axis of symmetry and is equipped with a means for securing to the suspension system. A frame of this type permits the production of false ceilings.
