Abstract (en)
[origin: EP0566539A1] The invention relates to a reinforcement for a masonry structure comprising a plurality of masonry blocks (2;2a,..., 2d) which have been laid one upon the other and between which there are provided joints (3) filled with mortar, which reinforcement comprises at least one reinforcing element (1) which is arranged at least partially in one of the joints (3) and is embedded in the mortar. In order to simplify the introduction, and to improve the stability, of said reinforcement, the invention provides at least one elastically pliable longitudinal element (4) in the form of a filament and/or thin bar which consists of a concrete-compatible, tension-resistant and non-metallic material. <IMAGE>
