Abstract (en)
[origin: EP0567369A1] The subject of the invention is a dispenser of household, cosmetic, pharmaceutical or other products of a certain consistency. It is formed by a cylindrical case (1) which has a pump (5) on top of it and is provided with a movable bottom (3) retained by a stop ring (4) but remaining accessible to an external thrust to be exerted by the operator. Two complementary peripheral bearing surfaces, one in the lower portion of the case, the other on the movable bottom, interact in order to create auxiliary sealing (A) by blocking (clamping) when this bottom is in the extreme low end-of-filling position. This solution avoids impairing the product and the operator can manually unblock (clear) possible fouling (gumming) and blocking of the seals. <IMAGE>
