Abstract (en)
[origin: WO9310325A1] The invention concerns a roller blind with a rotationally mounted self-locking winding shaft (3) and a shutter designed to be wound on to the shaft (3) and comprising a multiplicity of elements (4a, 4) hinged to each other, the uppermost shutter element being connected to the winding shaft. In order to make unauthorized separation of the shutter from the winding shaft (3) virtually impossible, the invention calls for the uppermost shutter element (4a) to be connected to the winding shaft (3) so that the two physically interlock.
